**Denca's 'liquid blending expertise' secures major contract with Rockline Industries**

**Rockline Industries, the global leaders in wet-wipe products, have appointed Widnes-based control technologies specialists, Denca, to complete a significant installation project at their Redditch UK plant.**

Having previously been involved in the successful installation of a sophisticated batch-blending system at the Redditch operation, Denca were chosen by Rockline Industries for the mechanical re-assembly, re-configuration and installation of a liquid blending plant from Rockline's wet-wipe production facility in Zalbommel, The Netherlands.

Split over three phases, to minimize any impact on production, Denca's scope of works involved the reconfiguration of all plant mechanicals to the 'Redditch specification', re-design of the control system, as well as software generation to meet current process requirements and legacy equipment.

"Having worked previously with Rockline Industries," comments Denca Joint Managing Director, John Talbot, "it was rewarding to be recognised for our high levels of expertise in batch control systems, as has been demonstrated across numerous industrial sectors both at home and overseas."

## **A reputation for quality and value**

Established in 1995, Denca Controls Ltd. has become renowned for delivering high quality, value-for-money solutions that enhance performance and embrace leading-edge instrumentation, electrical design and software engineering technologies. The company is recognised across numerous industrial sectors as 'the integrators of choice' and regularly secures repeat business from a wide range of organisations across the automotive, chemical, food & beverage, healthcare, pharmaceuticals and utilities industries. Working with clients of all sizes, Denca provides process control solutions based on custom-designed, fully integrated PLC and HMI software for both mechanical and electrical operations as well as UKAS-traceable calibration and certification services. Denca is committed to the delivery of imaginative, cost-efficient control systems and process automation systems that make a positive impact on production performance.
